

Your Asteroid Atlas

Close contacts. Connected patterns.

Alex Morgan · 14 March 1990 · 10:20 · London

15 bodies calculated. Three qualifying contacts.

The earlier sample left seven candidates uncalculated. Completing the catalogue preserves Pholus square the Sun and Pallas opposite the Moon, and adds Pelion opposite the Ascendant. The new contact belongs in the reading, with particular attention to birth-time precision.

This six-page review updates the selection and develops the new passage. It accompanies the 18-page sample sent on 12 October. Method, interpretation, permissions and commercial scope remain proposals for Benjamin Adamah's review.

Original synthesis and exercises by Johannes. Decorative cover geometry is not an orbital or horoscope diagram.

A direction you can negotiate.

The fictional brief. Alex divides the working week between client projects and personal creative work, and wants more sustainable commitments. These circumstances were supplied for the invented example; they are not inferred from planetary positions.

A private idea seeks a public form

Pholus in the twelfth house squares the Sun in the tenth, with an orb of $0^{\circ}02'16''$. In this proposed reading, an idea that takes shape away from the project meeting asks for a place in Alex's public work. The useful question is what can be tested before changing a wider commitment.

A shared plan needs a personal response

Pallas in the eleventh house opposes the Moon in the fifth, with an orb of $0^{\circ}09'40''$. A plan may serve a group well and still leave little room for the work Alex enjoys. An explicit conversation about that difference can be more useful than either silent accommodation or rejecting the whole plan.

The new angular contact changes the emphasis

Pelion is $0^{\circ}13'35''$ from the Descendant, in the seventh Placidus house. Under the proposed selection rule, this adds a question about how Alex's own intention becomes part of a one-to-one agreement. The reading now needs to examine who defines the terms of collaboration, alongside the private preparation and group planning already present.

The natal connection remains central

The Sun sextiles Saturn in the eighth house by $0^{\circ}19'13''$, while the Moon squares Saturn by $3^{\circ}42'22''$. The two earlier profiles therefore meet around shared resources and commitments. Pelion is a separate angular emphasis; the calculation does not establish an additional aspect chain from Pelion to Saturn.

Pelion at the meeting point.

29°56'45" Sagittarius · Placidus house 7

Opposition to Ascendant: 0°13'35". Equivalently, the same separation from exact conjunction with the Descendant. This is one contact, not two independent pieces of evidence.

Benjamin's public Centaur table associates Pelion with the development of individual will and aspirations. The following application is an original proposal: at the Descendant, Alex can explore how a chosen direction is voiced, negotiated and revised in an actual collaboration.

A clear intention is not a demand for agreement

For the fictional situation, Alex might arrive at the next client conversation with a precise account of available time and a proposal for how the work can proceed. This gives the other person something concrete to answer. It also makes it easier to distinguish a disagreement about scope from a judgment about the value of Alex's creative work.

Read the other side of the axis

The Ascendant is at 29°43'09" Gemini. Its ruler Mercury is in Pisces in the tenth house, close to the Sun. Words, public direction and the way an idea is presented belong in the wider reading. The Gemini-Sagittarius axis can be used as a question about moving between a specific account and a larger intention. It does not establish how any real partner behaves.

A concrete review question

Which part of a shared agreement did Alex actively choose, and which part was simply left unspecified? Write one sentence stating the desired contribution, one naming the available resource, and one describing what needs another person's agreement.

Time-sensitive. Five minutes later, Pelion falls in the sixth house and no longer meets the half-degree angular rule. Confirm a real recorded birth time before treating this profile as settled.

Every candidate is visible.

Tropical geocentric apparent positions. Placidus houses use ecliptic longitude. R = retrograde; D = direct. Selection uses full precision before rounding.

Body	MPC	Position	H	Motion	Selected
Ceres	1	25°28'27" Gemini	12	D	Outside
Juno	3	25°05'40" Scorpio	6	R	Outside
Eros	433	5°21'03" Pisces	10	D	Outside
Chiron	2060	10°34'05" Cancer	1	R	Outside
Nessus	7066	2°57'40" Libra	5	R	Outside
Orcus	90482	9°53'04" Leo	3	R	Outside
Makemake	136472	4°28'41" Virgo	4	R	Outside
Pallas	2	27°07'17" Aries	11	D	Yes
Vesta	4	22°37'45" Pisces	10	D	Outside
Pholus	5145	23°36'44" Gemini	12	D	Yes
Chariklo	10199	21°51'07" Gemini	12	D	Outside
Hylonome	10370	8°32'23" Virgo	4	R	Outside
Pelion	49036	29°56'45" Sagittarius	7	D	Yes
Okyrhoe	52872	14°58'21" Capricorn	7	D	Outside
Bienor	54598	28°49'44" Capricorn	8	D	Outside

Selection rule

Each candidate is tested against the ten planets, Ascendant and Midheaven for conjunction, sextile, square, trine and opposition, at a maximum orb of 0°30'. No minor-body-to-minor-body contacts or lunar nodes enter this selection. The catalogue and uniform rule are proposals, not Benjamin's complete practice.

The twelve bodies outside the rule are still calculated. "Outside" does not mean unimportant in every method or situation. It states the result of this specific filter.

Observe before you conclude.

Choose one upcoming collaboration that is small enough to examine clearly. The aim is to compare the proposed reading with experience, including observations that do not fit.

Before the conversation

Write the intention in plain language: what Alex wants to contribute, how much time is available and which part of the agreement needs to change. Keep the private creative project distinct from the client's deliverable.

During the conversation

Notice which terms become clearer. Record what was actually said and agreed, rather than interpreting the other person's motives. A refusal can clarify a limit without confirming an astrological story.

After one working interval

Review whether the revised agreement made room for the intended work. What helped? What remained unchanged? Would a different practical explanation fit the observation equally well?

My chosen intention

What actually happened

What does not fit / what I will revise

A reflection exercise for the proposed report, not a test of causation or a forecast. Pilot feedback should assess clarity, usefulness and the time required from readers.

The calculation record.

Input and conventions

14 March 1990, 10:20 London, 51.5074° N / 0.1278° W. Europe/London resolves to UTC+0. Swiss Ephemeris 2.10.03, pinned asteroid files, tropical geocentric apparent positions, true North Node. Placidus houses and ecliptic-longitude assignment, including high-latitude minor bodies. No silent change of house system or ephemeris is allowed.

Independent comparison

All fifteen bodies were compared with NASA/JPL Horizons at the fictional birth instant and at two additional epochs (1950 and 2026): 45 position comparisons. The largest longitude/latitude residual at birth is 0.945 arcseconds. Across all tests it is 3.863 arcseconds, for Orcus in 1950. Orbital solutions and coordinate models differ slightly; the test is not an assertion that every date has been checked.

Software and selection checks

Fourteen scenarios and 5,223 numerical comparisons agree between the native engine and browser. Tests include date extremes, daylight-saving gaps and repeated hours, unknown birth time, and unavailable polar Placidus houses. Contact geometry was also checked with an independent trigonometric expression. This verifies numerical behaviour, not the interpretation.

The important limit: birth-time precision

At 10:15 the Ascendant is 28°33'25" Gemini; at 10:25 it is 0°51'54" Cancer. Pelion is outside the half-degree angular limit at both endpoints; at 10:25 its longitude also falls in the sixth house. The complete catalogue changes the selection, but the new angular profile depends on a sufficiently precise recorded time.
